## Detection of Arsenic in Water Prabhas Biswas/JCGP

colourless & tasteless. Arsenic has no smell or colourless we tasteless. Arsenic has no smell or colouration when dissolved in water. Only water quality testing can determine its presence and concentration in water.

Arsenic is an element (As) that occurs naturally in the earth's crust-rock, soil and in the seas. People may also be exposed from industrial sources, as arsenic is used in semiconductor manufacturing, petroleum refining, wood preservatives, fertilizers, pesticides etc.

Arsenic can combine with other elements to form inorganic and organic arsenicals. In general, inorganic derivatives are regarded as more toxic than the organic forms. While food contains both inorganic and organic arsenicals, primarily inorganic forms are present in water. Where are typically two species of arsenic in water—"arsenic III" and "arsenic V". The numbers III & v describe the valency of arsenic in the molecule when arsecompound is dissolved in water. The forms of arsenic III or V is very important relative to the effectiveness of treatment methods. Yet, Arsenic V is generally easier to remove from water than Arsenic III.

If water quality tests have shown that the water has both an elevated concentration of iron and arsenic, then any rusty coloured untreated water should not be

2.	Rinse the reaction	on tube sev	eral times wit	th the sampl	0.
